

GHRP-6

Growth Hormone Releasing Peptide 6

GH RELEASE

APPETITE

MUSCLE GROWTH

HEALING

CORTISOL
CAUTION

WHAT IS IT?

GHRP-6 is a synthetic hexapeptide that stimulates GH release by acting on the ghrelin receptor. It produces large GH pulses and is known for its powerful appetite-stimulating effect — making it particularly useful in bulking or recovery phases where high caloric intake is needed. One of the original GHRPs.

DOSING AT A GLANCE

Dose	Frequency	Timing	Cycle
100–300 mcg	2–3x/day	Fasted	4–12 weeks

KEY BENEFITS

- Potent GH pulse stimulation — one of the strongest GHRPs
- Massive appetite increase (pro for bulking, con for cutting)
- Accelerated muscle growth when combined with caloric surplus
- Improved recovery — tissue healing and reduced DOMS
- Cardioprotective effects at therapeutic doses
- Anti-inflammatory via GH-mediated IGF-1 upregulation
- Improved sleep depth at bedtime dosing

HOW IT WORKS

GHRP-6 acts as a synthetic ghrelin agonist, binding to GH secretagogue receptor (GHSR-1a) in the hypothalamus and pituitary. This triggers somatotroph cells to release stored GH in pulses. It also amplifies GHRH-mediated GH release when stacked with CJC-1295.

PROTOCOLS

- **Bulking:** 200–300 mcg 3x daily (morning, pre-workout, bedtime) — embrace the hunger.
- **GH Optimization:** 100–200 mcg with CJC-1295 2x daily.
- **Bedtime Protocol:** 200 mcg before bed for sleep + GH pulse.

- **Note:** Eat 15–20 min after injection to maximize GH pulse before insulin rise.

SIDE EFFECTS

- Significant appetite increase (ghrelin effect — can be extreme)
- Cortisol and prolactin increase (unlike Ipamorelin) — monitor on long cycles
- Water retention
- Fatigue post-injection (expected GH pulse effect)
- Tingling, numbness (carpal tunnel-like at high doses)

STORAGE

Lyophilized: room temp. Reconstituted: refrigerate, use within 30 days.

■ ***Cortisol and prolactin elevation with frequent dosing — prefer Ipamorelin for cutting or long-term use.***
